How to Use a Basin Wrench

Model Nos. 03811 & 03812

The black 'wrench' part of the tool swivels on the silver bar to any angle you may need.

Grasp the tool where the 2 black jaw pieces meet (on the silver button) and work it back & forth—sometimes the tool is very tight and a shot of WD-40 or other spray lubricant will help it along.

Once you get the proper angle (usually perpendicular to the silver bar), the wrench works like any other wrench—the nut goes between the jaws—then you use the crossbar to turn the tool & loosen or tighten the nut.
